

Imagine A Translucid Playful Over An Opaque Sad

Opaque material bounces-off light while a transparent one, also called pellucid material, allows light to go directly through it with minimal scatterings; like clean water or glass.

Commonly referred to as translucency, translucid material is a state of matter that allows light to pass through, but does not necessarily follow Snell's law; *the photons can be scattered at either of the two interfaces or internally, where there is a change in the index of refraction. A translucid material is made up of matter with different indices of refraction* (Wiki). In other words, the translucid transgresses a law of nature.

I spent my Sunday trying to list translucid material around me and actually found it quite rare.

Marble Player
Oil/Acrylic on canvas
110x80 cm - 2021

In painting, the effect of this property is dependent on the first opaque layer on which transparency or translucency is applied. Hence, the opaque layer becomes the secondary monochromatic source of light. Scattered in and out.

Feelings and emotions might have the same properties. Tenacity is perhaps opaque. Disgust opaque. Gratefulness is transparent. Loving transparent. Hate opaque. Feeling vibrant transparent. Healthy transparent. Shy translucid. Charmed transparent. Mournful opaque. Embarrassed translucid. Pessimistic would tend towards opaque...

The list is long, interestingly there are few translucidس in both nature and human nature.

xx
